

PROJECT HANDOFF · ROLLIN' WITH MAHOMIES

MAHOMIE'S HUB

→ VERSION 2.0

Everything the next AI needs to pick up the league app: what it is, what v1.8 shipped, how to push and deploy, the rules that can't break, and the v2.0 roadmap. Part 1 is the prompt to paste in.

LIVE APP

mahomies-hub-production.up.railway.app

GITHUB

[poochinski/mahomies-hub](https://github.com/poochinski/mahomies-hub)

CURRENT → NEXT

[v1.8 live](#) → [v2.0](#)

PREPARED

[Oct 9, 2026](#) · Claude

THE PROMPT (COPY AND PASTE THIS)

You are taking over development of "Mahomie's Hub", a live web app (PWA) for my Sleeper fantasy football league "Rollin' with Mahomies". I'm Jayson, the commissioner. I am not a developer: explain things in plain words, and do the work yourself whenever you can.

THE PROJECT

- GitHub repo: <https://github.com/poochinski/mahomies-hub> (branch: main)
- Live app: <https://mahomies-hub-production.up.railway.app>
- Railway auto-deploys every push to main (about 2 minutes). Postgres is on Railway.
- Current version: v1.8 (live). We are starting VERSION 2.0 now.

READ THESE FIRST, IN FULL, BEFORE DOING ANYTHING:

1. <https://raw.githubusercontent.com/poochinski/mahomies-hub/main/BIBLE.md>
2. <https://raw.githubusercontent.com/poochinski/mahomies-hub/main/HANDOFF.md>
3. <https://raw.githubusercontent.com/poochinski/mahomies-hub/main/docs/V2-HANDOFF.md>
4. <https://raw.githubusercontent.com/poochinski/mahomies-hub/main/CHANGELOG.md>

If you can't open them, tell me and I'll paste them.

HOW TO WORK

- Follow BIBLE section 12 (working rules) and section 17 (v2.0 rules).
- If you can push to GitHub yourself (GitHub connector / Codex / Copilot agent): commit straight to main in small, working chunks. Railway deploys each push. Use commit author: Jayson <editfilminc@gmail.com>.
- If you can't push: give me COMPLETE files (or exact find/replace blocks with the file path) plus the terminal commands for GitHub Codespaces:

```
git add -A
git commit -m "Short description"
git push origin main
```

and remind me Railway auto-deploys from that push.
- Every push must also update HANDOFF.md (rewrite it), add one line to the top of CHANGELOG.md, and update BIBLE.md when a rule, feature or decision changes.
- Never leave the app broken between pushes. My usage with you can run out anytime.
- After a push, check the live app: /api/health must say ok, and the change must show on the phone-size page (390px wide).
- The v2.0 front end is prototype/v2.0/app.html + app.css + app.js (edit them directly, no build step). Never edit prototype/v1.x folders or prototype/dist.

FIRST: tell me the current goal, what's done, what's next, and open bugs from

the handoff, then propose the v2.0 plan (start with the Home page rework in docs/V2-HANDOFF.md Part 4) and ask me to say go.

PART 2

WHAT THE APP IS

Mahomie's Hub is the league's own app: a **fantasy companion, history book, stats hub and hall of fame first**, with a **fun side game: a play-money sportsbook** using *Mahomie Bucks* 💰. It reads everything from Sleeper and keeps the league's whole history (2023–2026) in one place, including managers who left (tagged "Former").

League facts: Sleeper league_id `1312104253497540608` (2026), 12 teams, PPR, **2026 adds a league-median game** (every week you also win if you score in the top half). Playoffs: top 6, top 2 get byes. Commissioner (app admin) user_id `862901935416655872`.

Identity rules (Jayson's decisions):

- Betting numbers (win %, lines, odds, spreads) appear **only inside the Book tab**. Everywhere else is fantasy + history.
- **No "Banana Bets" branding anywhere** (that's a different app of Jayson's). Names: *Mahomie's Sportsbook*, *Mahomie Bucks* 💰, *On Fire* 🔥 (weekly high), *Ice Cold* 🧊 (weekly low), *Sportsbook Champion*.
- Logo: gold "MH" + football (public/brand-96.png, app icons). Look: "Night" theme (dark purple ground, gold/pink/cyan/green accents, Chakra Petch + IBM Plex fonts). Mobile-first, 390px wide.
- Header scrolls with the page (not pinned). Plain-English "❓ How it works" explanations on every stat.

Tech: Node 18+ / Express server (`server/`), Postgres on Railway, vanilla-JS single-page front end, PWA manifest + MH icons. No front-end framework. No service worker (an old one self-removes).

WHAT'S BUILT (V1.0 → V1.8)

Version history

VERSION	DATE	WHAT IT ADDED
Phase 0	Oct 7	PWA shell, Express, /api/health , /api/state (Sleeper history chain), Railway
v1.0	Oct 8	Prototype with real league data, game sheets, /api/game box scores
v1.5	Oct 9	Week picker + recaps, season pages + brackets, playoff odds, awards, H2H grid, capped Book lines, previews, share cards, records filter, Lab endpoints
v1.6	Oct 9	Swipe cards, Explore tiles, League tile menu, Awards page
v1.7	Oct 9	One-screen Home, compact Awards, record picker
v1.8	Oct 9	The real Sportsbook in the app + everything below

Old builds stay reachable: [/test/v1.8](#), [/test/v1.7](#), [/test/v1.6](#), [/test/v1.5](#), [/test/v1.0](#). Saved branches: [release-v1.0](#), [release-v1.5](#), [release-v1.6](#), [release-v1.7](#), [release-v1.8](#) (git tags can't be pushed).

Tabs and features (live now)

Home — Week banner; *Your game* card (both teams, live score, record + place; tap → matchup preview: form bars, keys to the game, all-time series, last meeting); *This week* grid of all 6 live scores; *Last week* tiles (🔥 high score, 🧊 low score, ⭐ top player) + recap link; *Explore* 3×3 shortcuts; footer with data time.

League — Standings (W-L incl. median, PF, all-play, luck, playoff line) · Power rankings (0–100 percentile blend) · Playoff odds (5,000 simulated seasons) · Awards (Champion, Sacko, Points King, On Fire, Ice Cold, Horseshoe, Snakebitten, Punching Bag, Monster Week, Bully, Heartbreaker; live leaders in season) · History (season podiums, brackets, every week) · All-time table · Rivals (H2H grid + rivalry cards) · Lab: **Bench Shame**, **Trade grader v2** (who got what, points started per week, verdict scale, weekly tracker sheet, chart, team impact), **Draft re-grade** (steals/busts).

Records — Record book (regular season / playoffs filter): high/low scores, blowouts, closest games, best player games, streaks, with full details and unit labels.

Me — Pick your team or log in; manager profile (career, seasons, head-to-head); "How the app works" list; **commish Book controls**.

Book (Mahomie's Sportsbook) — details in BIBLE §7:

- Team + 4-digit PIN login (first login sets the PIN; 5 wrong → 15-min lock; 180-day sessions).
- **1,000 Bucks once per season, no re-buys** (broke = done for the season).

- Lines post **Tuesday 6 AM PT**: projection = 60% Sleeper lineup projection + 40% league history; spread cap 20; spreads/totals -110; moneyline 4.5% hold.
- **Nothing locks — live in-game odds**: once a matchup's first starter kicks off, expected final = Sleeper live projected totals (points so far + projection for players left, from ESPN game clocks); price moves with the score; a moneyline side comes off the board past -1000; "Odds moved" protection.
- **Player props** (over/under on a starter's fantasy points, line = Sleeper projection x.5, -110; no under on your own player).
- Bet slip: Singles or Parlay (2-4 legs, one pick per fantasy matchup), **confirm screen**, casino-style **tickets** with the MH logo showing the bettor, shareable as an image.
- My bets, Leaders (bankroll leaderboard), league bet feed. Cancel only before kickoff.
- **Settlement Wednesday 3 AM PT** after stat corrections.
- Commish: Book health check, post lines, move/void a line, settle a week, **add/take away Bucks for any team incl. yourself** (balances, quick amounts, reason, ledger; can't go below 0), reset a PIN, Book log.

Secret Easter egg — "Gridiron Gold" slot machine. On the Book tab, tap the **pink dot** (2nd of the 4 footer dots). **Never list it in menus, help or "How it works"**. Casino cabinet (drawn symbols, marquee lights, LED meters, paylines, slam stop, anticipation, rollups, BIG/MEGA/EPIC wins), WebAudio sounds with volume slider, MH wild, free spins (x3), **Two-Minute Drill** hold-and-spin bonus with MINI/MINOR/MAJOR/GRAND jackpots. Server-decided outcomes, **92.51% payback = Las Vegas Strip average** (exact par sheet: `node server/slots/par.js`). Uses real Mahomie Bucks.

Server / API (all under `/api`)

`/health` · `/state` · `/hub` (whole app data, rebuilt from Sleeper; app refreshes every 3 min) · `/game` (box scores) · Lab: bench / trades / draft · `/book/*` (status, teams, login, logout, me, lines, bets, cancel, leaderboard, feed, slots/, *admin/*). Background job every 10 min: post lines Tue 6 AM, keep live state, settle Wed 3 AM. Database tables: app_users, sessions, book_weeks, lines, bets, bet_legs, bankroll_ledger (balance = sum of ledger), book_settings, book_log, slot_state, slot_spins.

Railway environment variables

`DATABASE_URL` = `${{Postgres.DATABASE_URL}}` (required). Optional (defaults in code): `SLEEPER_LEAGUE_ID`, `COMMISH_USER_ID`, `PORT`. Test-only: `BOOK_FAKE_NOW`, `BOOK_JOBS`, `SLEEPER_BASE`, `ESPN_BASE`, `SLEEPER_PROJ_BASE`.

VERSION 2.0: WHERE TO TAKE IT NEXT

2.0 — Home page rework (do this first)

From the Home audit (2026-10-09):

1. **Fix the "Live" badge** — today it means "connected to the server", not "games in progress". Show live only when an NFL game in the week is in progress (ESPN states); otherwise "Next kickoff Thu 5:15 PM".
2. **Replace the giant "Week 6" title** with a week-phase line: *Waivers run Wed, Game day, Monday night: 2 games left*.
3. **Your game card**: add projected final (Sleeper live projections — the Book already computes them in `server/book/data.js weekState`), players left / playing now, and pregame projections instead of 0.00 vs 0.00. Say "Pick your team" if nobody is chosen.
4. **Median tracker**: "You're 4th of 12 this week — on track for the median win." (half of every 2026 week is invisible today).
5. **Lineup alert**: starter OUT / on bye / empty slot (weekState already detects "slots not playing").
6. **Standings strip**: your seed, games back of the playoff line, playoff odds.
7. **This week grid**: no cut-off names (one game per row), remove your own game, sort by closest, tags like "6-0 all-time", "Final", "Upset brewing".
8. **Put the one-sentence recap on Home**. Shrink *Explore* to one row (tabs already cover it); keep *This week in history*.

2.1 — Live Game Center

Player-by-player view of any matchup during games: points, live projection, game clock/status, who's left, "needs X from Y" on Monday night. This keeps people in the app on Sundays instead of Sleeper.

2.2 — Sportsbook batch 2

Weekly specials (On Fire / Ice Cold winner, low-score over/under), weekly best bettor, **Sportsbook Champion** in Awards + Hall of Fame. Bet lines first go up **Tue Oct 13, 6 AM (Week 6)**; first real settlement Wed Oct 21, 3 AM — check both.

2.3 — Futures + playoffs

Title and Sacko futures from the season sim (repriced Tuesdays). Playoff-week lines (weeks 15–17, bracket games only).

2.4 — League Wire

A running feed: trades (with early grade), big waiver adds, records broken, streaks, On Fire/Ice Cold changes, median-game drama. Waiver Wizard tracker (points from mid-season pickups).

2.5 — Engagement

Web push notifications for installed PWAs (lines posted, bet settled, record broken; iOS 16.4+), shareable record cards, Hall of Fame inductions with league voting, trophy case per manager.

2.6 — Commish + extras

Start/Sit helper (commish-only first), "How sharp is the Book?" accuracy page, survivor side game, dues/payouts ledger (tracking only), awards voting.

Still missing / to verify

- Lab endpoints only tested on fake data — verify with real Sleeper data on Railway.
- Gridiron Gold sounds not yet heard on a real phone; check volume and the iPhone silent switch.
- Playoff-odds tiebreaker assumes points for; confirm the league's real setting.
- First login to a team claims its PIN; commish can reset.
- Sportsbook early-season lines can be wide; review after Week 8.

PART 5

WHERE THE CODE LIVES (V2.0)

```
server/index.js      Express app; serves the v2.0 page (app.html + snapshot data)
server/hub/build.js   builds /api/hub (every stat) from Sleeper
server/book/         engine.js (odds math), book.js (rules, jobs, bets), data.js
                     (Sleeper/weekState), kickoffs.js (ESPN), schema.sql
server/slots/         engine.js (reels, pays, PAR), slots.js (spins + ledger), par.js (exact
                     payback), sim.js
server/routes/        state, game, lab, hub, book
prototype/v2.0/app.html page shell (head, header, tab bar, sheet) – EDIT THIS
prototype/v2.0/app.css all styles – EDIT THIS
prototype/v2.0/app.js  all front-end code – EDIT THIS
prototype/v2.0/snapshot.json bundled data used until /api/hub loads (refresh it occasionally from
                     /api/hub)
prototype/v1.x/, prototype/dist/ frozen old builds – DO NOT EDIT
public/              icons, logo, fonts (Bungee, Orbitron for the slot)
BIBLE.md  HANDOFF.md  CHANGELOG.md  docs/V2-HANDOFF.md
```

Front-end notes: `app.js` is one big function (no modules). Data object `D` (from `/api/hub`), state `S`, `render()` draws the current tab, one delegated click handler reads `data-*` attributes, bottom sheets via `openSheet(html)`. Sportsbook calls go through `api(path, {body})` to `/api/book`. Tabs: `home()`, `league()`, `records()`, `book()`, `me()`.

Testing: run locally with `npm install` then `DATABASE_URL=... node server/index.js` (port 3000), or test on Railway after the push. Always look at the page at 390px wide.

PART 6

RULES THAT MUST NOT BREAK

1. Fantasy/history first; betting numbers only in the Book tab.
2. No Banana Bets names or assets.
3. Mahomie Bucks are play money only. Never add real-money payments.
4. 1,000 Bucks per season, no re-buys; commish adjustments always logged with a reason.
5. Nothing locks in the Book; live odds move with the score. Every bet has a confirm step.
6. The slot stays secret and keeps a Nevada-style design: independent server RNG, fixed strips, re-run `par.js` after any math change and keep payback $\approx 92.5\%$.
7. Never call Sleeper from the browser; the front end only talks to `/api`.
8. Never put secrets in code; they go in Railway variables.
9. Every push: working app + updated HANDOFF.md + CHANGELOG line (+ BIBLE when rules change).
10. Mobile first (390px), plain-English explanations, and Jayson approves anything that changes how the league experiences the app.
